SECTION 8 Other Events

Item 8.01 Other Events

Nord Resources Corporation (Nord) has issued a news release announcing that Nord has completed the phase 2 ground geophysical survey (Induced Polarization IP, and Resistivity) at the Coyote Springs property. Nord holds an exclusive option to purchase the two State of Arizona exploration leases and 52 unpatented mining claims on the property, which is a porphyry copper-gold exploration target with exposed, surface copper oxides and considerable potential for deeper copper sulfides. The purpose of the survey was to confirm the initial drill target located during the phase 1 geophysical survey, and was undertaken as part of Nord s preliminary exploration activities that are intended to help it determine whether it should exercise the option. Additional information regarding Nord s option to purchase agreement may be found in the company s SEC filings.

The work was performed by Zonge Engineering & Research of Tucson, Arizona, under the direction of Anthony M. Hauck III, Consulting Geophysicist and J.P. Matthews, Consulting Geophysicist. The phase 2 survey confirmed anomalous IP values at depths in excess of 1000 meters. The anomaly, which has been located along a north 30 east line and two east west lines on the down-thrown side of the Foothills Fault, is, according to Mr. Hauck, characteristic of a deep, mineralized porphyry, and is considered a viable drill target . Further, the inverted resistivity results for line 2 show an overlying resistivity low at about 1000 meter elevation which could be due to an oxidized porphyry.

Based on the results of the phase 2 geophysics, a phase 1 drill program has been planned to initially test the anomaly. The drilling is scheduled to commence on or around February 21, 2007. The drilling will be conducted by Boart Longyear.

SECTION 9 FINANCIAL STATEMENTS AND EXHIBITS

Item 9.01 Financial Statements and Exhibits
